

FlowMetrics Customer Success Dashboard

SaaS Customer Success Analytics Case Study

Prepared by: Chioma Iwuchukwu

Target Roles:

- Customer Success Specialist
- Guided Onboarding Specialist
- Customer Success Operations
- Customer Success Analyst

Tools Used:

Microsoft Excel • Power BI • Power Query • DAX

Project Type:

Customer Success Analytics & Business Intelligence

Date:

August 2026

1. Project Overview

FlowMetrics is a fictional SaaS company created to simulate a real-world Customer Success environment. This project demonstrates how customer data can be transformed into actionable insights that help Customer Success teams improve onboarding, product adoption, customer health, and renewals.

Using a realistic dataset of 500 SaaS customers, I analyzed customer onboarding progress, health scores, feature adoption, login activity, support ticket trends, customer satisfaction (CSAT), renewal status, and churn risk. After preparing and validating the data in Microsoft Excel, I built an interactive Power BI dashboard featuring KPI cards, business-focused visualizations, DAX measures, and slicers for Subscription Plan, Industry, and Risk Category.

The dashboard enables Customer Success teams to monitor customer health, identify at-risk accounts, evaluate onboarding performance, and make data-driven decisions to improve retention and customer outcomes. This project demonstrates practical skills in Customer Success analytics, business intelligence, Excel, Power BI, DAX, and KPI reporting.

2. Business Problem

Customer Success teams need timely, data-driven insights to identify customers who require additional support before they become disengaged or fail to renew. Without a centralized view of onboarding progress, customer health, feature adoption, product usage, support activity, and renewal status, it is difficult to proactively manage customer relationships and reduce churn.

This project addresses that challenge by simulating a Customer Success environment for a fictional SaaS company, FlowMetrics. Using customer lifecycle data from 500 organizations, the project demonstrates how interactive reporting can help Customer Success teams monitor key performance indicators, identify at-risk accounts early, improve onboarding outcomes, increase product adoption, and support higher customer retention.

3. Project Objectives

The primary objective of this project was to design an interactive Customer Success dashboard that provides actionable insights into customer onboarding, engagement, product adoption, and retention.

Specifically, the project aimed to:

- Monitor customer onboarding progress and completion rates.
- Track customer health using key success metrics.
- Measure feature adoption and product usage across subscription plans.
- Identify customers at risk of churn based on health scores, login activity, and support ticket trends.
- Evaluate customer satisfaction (CSAT) and renewal performance.
- Enable Customer Success teams to make proactive, data-driven decisions that improve customer outcomes and retention.

4. Dataset Description

To simulate a real Customer Success environment, I created a fictional dataset containing 500 SaaS customers from ten industries and four subscription plans. The dataset was designed to reflect common customer lifecycle metrics used by Customer Success teams to monitor onboarding, engagement, customer health, renewals, and churn risk.

The dataset includes customer profile information, onboarding progress, product usage, feature adoption, support activity, customer satisfaction (CSAT), health scores, renewal status, and churn risk indicators. Realistic business rules were applied to create meaningful relationships within the data, including customer health distribution, risk categories, login frequency, support ticket volumes, and renewal outcomes.

This structured dataset enabled realistic analysis and the development of an interactive Power BI dashboard that supports data-driven Customer Success decision-making.

5. Tools Used

The following tools were used to complete this project:

- **Microsoft Excel** – Data creation, validation, PivotTables, and exploratory data analysis.

- **Power BI Desktop** – Interactive dashboard development and data visualization.
- **DAX (Data Analysis Expressions)** – Creation of KPI measures and business calculations.
- **Power Query** – Data import and preparation within Power BI.
- **Data Visualization** – Executive dashboard design using KPI cards, charts, and slicers.
- **Customer Success Analytics** – Analysis of onboarding performance, customer health, feature adoption, customer satisfaction, renewals, and churn risk.

6. Data Preparation & Methodology

The project began by creating a realistic dataset of 500 fictional SaaS customers using predefined business rules to simulate Customer Success scenarios. The dataset was reviewed in Microsoft Excel to validate data quality, ensure consistency, and perform exploratory analysis using PivotTables.

The dataset was then imported into Power BI, where DAX measures were created to calculate key performance indicators such as Average Health Score, Average CSAT, Average Onboarding Completion, Average Login Frequency, Average Support Tickets, Feature Adoption, and Renewal Rate.

Interactive visualizations, KPI cards, charts, and slicers were designed to enable users to explore customer performance by subscription plan, industry, and risk category. The final dashboard provides a clear, executive-level view of customer onboarding, engagement, health, and retention metrics.

7. Dashboard Overview

The FlowMetrics Customer Success Dashboard provides an executive-level view of customer onboarding, engagement, adoption, and retention. It was designed to help Customer Success teams monitor key performance indicators, identify at-risk customers, and make proactive, data-driven decisions.

The dashboard includes KPI cards displaying Total Customers, Average Health Score, Average CSAT, Average Onboarding Completion, Average Days to Complete Onboarding, and Renewal Rate. Interactive charts visualize customer risk distribution, health scores by industry, feature adoption by subscription plan, login frequency by risk category, and support ticket trends. Slicers for Subscription Plan, Industry, and Risk

Category enable users to filter the dashboard and explore customer performance across different segments.

Together, these visualizations provide a comprehensive view of customer success performance and help teams identify opportunities to improve onboarding, increase product adoption, reduce churn risk, and support customer retention.

8. Key Business Insights

Analysis of the 500-customer dataset revealed several important Customer Success trends:

- **Most customers are healthy.** Approximately 67% of customers were classified as Low Risk, indicating strong overall customer health and engagement.
- **Real Estate customers require additional attention.** Among all industries, the Real Estate segment recorded the lowest average Health Score, suggesting an opportunity for targeted customer success initiatives.
- **Feature adoption remained consistent across subscription plans.** Average Feature Adoption was approximately 74% across all plans, indicating that customers were actively using core product functionality regardless of subscription level.
- **Product usage strongly correlated with customer health.** Low-risk customers logged into the platform significantly more frequently than medium- and high-risk customers, making login activity an effective early indicator of customer engagement.
- **Support ticket volume increased with customer risk.** High-risk customers generated substantially more support tickets than low-risk customers, suggesting that frequent support requests may serve as an early warning sign for churn risk.
- **Customer satisfaction remained strong.** The average CSAT score was 4.1 out of 5, indicating generally positive customer experiences.
- **Onboarding performance was positive but offered room for improvement.** Customers achieved an average onboarding completion rate of approximately 76%, with an average onboarding duration of 26 days.

9. Business Recommendations

Based on the analysis, the following recommendations could help improve customer success outcomes:

- **Implement proactive outreach for high-risk customers** by using Health Scores, login frequency, and support ticket activity as early warning indicators. Customer Success Managers can schedule check-ins before renewal periods to reduce churn risk.
- **Strengthen onboarding for lower-performing customer segments**, particularly industries with lower average Health Scores. Tailored onboarding plans and milestone tracking can improve customer activation and long-term engagement.
- **Increase feature adoption through targeted enablement.** Regular product training sessions, webinars, and in-app guidance can help customers discover and adopt additional product features.
- **Monitor support trends alongside customer health.** Customers with increasing support ticket volumes should receive proactive assistance to resolve recurring issues and improve their overall experience.
- **Use dashboard insights during Customer Success reviews.** Regularly reviewing key metrics such as onboarding completion, Health Score, CSAT, and Renewal Rate enables teams to make data-driven decisions and prioritize customer success initiatives.

10. Skills Demonstrated

This project demonstrates the following technical and business skills:

- Customer Success Analytics
- Customer Health Monitoring
- Guided Onboarding Analysis
- Customer Lifecycle Management
- Customer Retention & Churn Analysis
- KPI Development and Reporting
- Microsoft Excel (PivotTables, Data Validation)
- Power BI Dashboard Development
- DAX (Data Analysis Expressions)
- Power Query
- Data Visualization
- Business Intelligence
- Data Analysis and Reporting

- Business Insight Generation
- Executive Dashboard Design

11. Conclusion

The FlowMetrics Customer Success Dashboard demonstrates how data analytics can be used to support proactive Customer Success strategies. By analyzing onboarding performance, customer health, product adoption, engagement, support activity, and renewal trends, the dashboard provides actionable insights that help identify at-risk customers and improve retention outcomes.

This project showcases my ability to combine Microsoft Excel, Power BI, DAX, and business analysis to solve a realistic Customer Success challenge. It reflects my approach to transforming customer data into meaningful insights that support better decision-making, stronger customer relationships, and long-term business growth.
